<p>“Electrohypersensitivity conference debunks ‘nocebo effect’ theory”</p> <p>Dr. David Carpenter: [despite the lack of scientific consensus on its causes and mechanisms] »the evidence is strong enough to declare that electromagnetic hypersensitivity is real; it can even be triggered by a slight shock, but each individual reacts differently. Many people are unaware that it is the cause of their various nonspecific symptoms that have long described as neurasthenia. It is important to design objective tests to determine which patients are truly hypersensitive while recognizing that some symptoms can be psychological in origin. I do think that viewing EHS and MCS as having many things in common is right on. In addition I would add chronic fatigue, fibromyalgia and Gulf War Illness to the list of idiopathic environmental intolerance diseases. ... We should not only be concerned with the frequency and power of microwaves. Sudden spikes of frequency transients and harmonics may well be what we should be more concerned about. It’s the same phenomenon that occurs with wireless devices such as smart meters that emit very short pulses of high intensity.«</p> <p>Dr Carpenter added that a classroom full of children using laptops hooked up to the Internet with wireless Wi-Fi routers can »generate an enormous level of radiofrequencies (RFs) which may be enough to trigger the development of EHS which will continue for life.« Close to sources of such EMFs, people with EHS typically develop headaches, fatigue. mental dullness, irritability and a general reduction in ability to function. »Not only are children more vulnerable to every environmental exposure, he said, but if we allow our children in schools, where they are supposed to be learning, to be exposed to an agent that reduces their ability to pay attention and to learn and promotes illness, this is a tragedy, it’s foolish and we should act right there to reduce the exposure... A wired computer classroom will not result in [RF] exposure connection, will have the same access to the Internet that every child needs, but to rush ahead and to make everything wireless without contemplating the long-term health effects is unwise.« (cited from)</p>	<p>Maison Saine 25Jun2015</p>

„Informationsmappe Elektromog“ Jan2008	Land Salzburg, Dr. Gerd Oberfeld

Empfehlungen des [dt.] Bundesamtes für Strahlenschutz zum Telefonieren mit dem Handy	
»Beim Mobilfunk werden hochfrequente elektromagnetische Felder zur Übertragung von Informationen eingesetzt. Handys erzeugen diese Felder beim Telefonieren ohne Freisprecheinrichtung direkt am Kopf. Nach dem derzeitigen wissenschaftlichen Kenntnisstand reichen die aktuellen Grenzwerte aus, um vor nachgewiesenen Gesundheitsrisiken zu schützen. Allerdings bestehen nach wie vor Unsicherheiten in der Risikobewertung, die durch das Deutsche Mobilfunk-Forschungsprogramm nicht vollständig beseitigt werden konnten. Diese betreffen insbesondere → mögliche gesundheitliche Risiken einer langfristigen Belastung mit hochfrequenten elektromagnetischen Feldern durch Telefonate mit dem Handy bei Erwachsenen (intensive Handynutzung über mehr als 10 Jahre) → die Frage, ob sich die Nutzung von Mobiltelefonen durch Kinder gesundheitlich auswirken könnte.«	
»Aus diesen Gründen hält das BfS einen vorbeugenden Gesundheitsschutz (Vorsorge) weiterhin für erforderlich: Die Exposition durch elektromagnetische Felder sollte so gering wie möglich sein.«	

Tipps für den Umgang mit dem Handy: »Die elektromagnetischen Felder, die beim Telefonieren mit Handys in Körpernähe auftreten, sind im Allgemeinen sehr viel stärker als die Felder, denen man beispielsweise durch benachbarte Mobilfunkbasisstationen ausgesetzt ist.«

»Ganz besonders wichtig ist die Minimierung der Strahlenbelastung für Kinder. Sie befinden sich noch in der Entwicklung und könnten deshalb gesundheitlich empfindlicher reagieren.«

11Feb2014

„Der Stand der Forschung zur Mobilfunkstrahlung“

Dr. Joachim Mutter 5Jul2012

Führt eine große Anzahl von Studien an, die **gesundheitliche** Auswirkungen der Mobilfunkstrahlung *unterhalb* der Grenzwerte belegen, Studien, die nach Ansicht der Bundesregierung gar nicht existieren (siehe 15. Mobilfunkbericht der dt. Bundesregierung 2013). Sodann zeigt Dr. Mutter in vielen Details, wie die Mobilfunk-Lobby die öffentliche Darstellung der Gesundheitsgefahren manipuliert und unterdrückt.

„Mobilfunk – Die verschwiegene Gefahr“

Klaus Weber 2012

„Schwerwiegende Gründe für die Ablehnung des Baus eines Mobilfunkmastes“

Zahlreiche Aspekte des Umgangs mit den Gefahren des Mobilfunks. Der ICNIRP-Grenzwert von 10 Mio $\mu\text{W}/\text{m}^2$ schützt vor einem Risiko, welches gar nicht existiert, nämlich Erwärmung des Körpergewebes. Die nicht-thermischen Auswirkungen wurden bei der Festlegung des Grenzwertes nicht berücksichtigt. – Die Versicherungsgesellschaften versichern die Mobilfunkbetreiber wegen nicht kalkulierbarer Risiken nicht. (Der Rückversicherer "SwissRe" stuft die potenziellen Auswirkungen von Handy- und Mobilfunkstrahlung in die höchste Risikoklasse ein.)

BUND: Bund für Umwelt- und Naturschutz: Positionspapier Elektrosmog 2008:

»Da der Gesetzgeber darauf verzichtet hat, Anforderungen zum Schutz vor nicht-thermischen Wirkungen durch Elektromagnetische Felder in das Bundes-Immissionsschutz-Gesetz aufzunehmen, ist bei diesen Wirkungen ein rechtsfreier Raum entstanden; ein Rechtsschutz für Betroffene besteht praktisch nicht.«

2008

Shirley Temple via Plataforma Estatal Contra la Contaminación Electromagnética - Peccem

Commentario respetando a nextup.org

»Un escándalo sanitario que nos alcanza a todos. !!

EHS: ¿Quién va a pagar el desastre de salud?

- En 2105 en los países de Europa el 5% de la población es EHS.

- En Francia hay 3,3 millones de personas que son EHS de las cuales 70.467 están declaradas nominalmente

La OMS y EHS, la realidad y el tercer escándalo sanitario:

- Durante décadas, los científicos de la OMS con conflictos de interés declararon que fumar no

era perjudicial.

- Durante décadas la OMS, las autoridades sanitarias y la Academia de Medicina informaron que el amianto

no era perjudicial, (al igual que los Contadores Inteligentes que son un producto tóxico)

Actualmente , en Francia , este es el resultado : Después de un desastre de salud, miles de muertos, cientos de miles de pacientes y decenas de millones de techos forrados de amianto.

Si demoler una casa en Francia cuesta aproximadamente €5.000 a los propietarios, hay que sumar otros 25.000 euros por la retirada de amianto!

¿Quién paga, Eternit y funcionarios de las autoridades de salud, algunos de los cuales todavía están en su lugar y también los responsables?

Por lo tanto, la OMS ha perdido toda credibilidad con el prevaricador Repacholi responsable de su programa

EMF y, además, fundador-presidente de la organización industrial ICNIRP en contravención de la Carta de la OMS.

Repacholi violó impunemente todas las normas éticas de la OMS, esto es indignante y vergonzoso!

Publicado hoy por la ONG francesa Next-up. n°2986,11/09, 2015.«

Lyme disease or an Electronic and Electrical Magnetic Disturbances

© George

Parker

»I live in Australia, and our country doesn't have the "Lyme Disease (LD)". A tick can bite us, but our ticks are not supposed to have the bacterium called "Borrelia". But lately, over the past few years, somehow or another, the bacterium has flown across the Pacific Ocean, and we now seem to have a manifestation of LD in Australia, the same as many Americans. It's interesting to note that ME/CFS/FMS had also increased soon after the introduction of wireless technology. Our tick is extremely deadly, called a paralysis tick, and there is no record, EVER, that they have this bacterium.

I hear many Americans on forums claiming they have LD, but they don't show the characteristic pink/red rash that appears like a bulls-eye, which is claimed to appear between 3 and 32 days after being bitten by an "INFECTED" tick; and it's known that NOT everyone with LD gets the rash, which now opens a can of worms for a possibility of a misdiagnosis or self-diagnosis. We need to also be aware that the same sort of rash has been noted by avid mobile phone users.

The general LD symptoms are: fever; fatigue; headaches; myalgia; arthralgia; tiredness; muscle and joint pain; and sore and swollen lymph glands; and in the later stages of LD, the infection can spread through the bloodstream and body tissue causing other symptoms like extreme rheumatoid arthritis, which I believe is another diagnosis, when electrical fields (ELF) and electromagnetic radiation (EMR) (microwave non-ionised radiation).

Those general neurasthenic symptoms are exactly the same general symptoms for Neurasthenia, Myalgic Encephalomyelitis (ME), Chronic Fatigue Syndrome (CFS), Fibra Myalgia Syndrome (FMS), Sick Building Syndrome (SBS), Multiple Chemical Syndrome (MCS), Electro Magnetic Syndrome (EMS), Electro Sensitivity Syndrome (ESS), Radio Sickness, Radar Sickness, microwave illness, microwave syndrome, EMF Syndrome, Burning Mouth Syndrome, Electro Hyper Sensitivity Syndrome (EHSS), and a number of other syndromes that exhibit strange and abnormal symptoms that are slightly dissimilar, including Multiple Sclerosis (MS).

Other symptoms known that could be classified as being caused by the LD infection of the bloodstream and body tissues are once again similar to the other symptoms of the above "syndromes", such as:

- (1) Neurological: dizziness, nausea; memory and concentration difficulties; insomnia; depression; anxiety; fatigue/weakness; numbness/burning/tingling sensations; and muscle and joint pains.
- (2) Eyes: pain and discomfort; pressure in the eyes; deteriorating vision; and cataracts.

(Note: When a LD sufferer suffers some of these above symptoms in (1) and (2), they are diagnosed as a possible infection of the brain and membranes surrounding the brain, causing a form of meningoencephalitis, or neuroencephalitis. It has been seen that encephalitis can be caused by ELF/EMR.)

- (3) Cardiac: heart palpitations/arrhythmia (disorder of the heart pulse or rhythm, such as beating too fast (tachycardia), or too slow (bradycardia), or irregularly); shortness of breath; and high blood pressure.

(Note: The ailment of the heart can be seen as an infection in or around the heart known as endocarditis, myocarditis or pericarditis. The disease can also cause inflammation of joints and cause joint pain and long-term neurological involvement.

(4) Ears: Tinnitus (ears ringing, moderate to severe); and hearing loss.

(5) Other: skin problems (rash or blood ruptures under the skin); digestive problems (Irritable Bowel Syndrome (IBS) or diverticulitis); dehydration; nosebleeds; impaired sense of smell; light sensitivity; and metallic taste in mouth and burning/tingling sensations in the mouth (diagnosed as Burning Mouth Syndrome (BMS)).

There are many other strange symptoms of long-term effects.

In Australia, LD cannot be ruled out; as they believe it's possible that LD could be imported through the risk of overseas-acquired LD being imported into our country, which can't be spread from person to person, but there is a possibility that a tick could bite a tourist who has LD and that tick could then transmit the bacterium into another host, animal or human, which is unlikely.

LD is diagnosed based on symptoms, physical findings (such as, the characteristic rash), and the possibility of exposure to infected ticks. Diagnosis requires a combination of clinical experience and assessment by the doctor, an understanding of the lab tests and their limitations, because they are rarely definitive and all tests have a proportion of results, which are false positive test (indicates disease in someone without the disease), and false negative test (indicates that there is no disease in someone with the disease). Therefore, we find that many positive tests will be falsely positive.

The laboratory tests to diagnose LD are technically complex and require specialist expertise, and are performed by an accreditation with the National Association of Testing Authorities (NATA). We cannot self-diagnose, or accept local and general medical diagnoses by a general practitioner.

On that note, through long-termed and prolonged exposure to wireless technology it is known that symptoms from ELF/EMR, being misdiagnosed or intentionally diagnosed as LD to take the heat off the telecom companies. The medical science state that most undiagnosed illnesses are credited to "free radicals", which are linked to some form of an environmental factor, possibly "neurotoxins", but whatever it is, it destroys the motor neurons and cells of a person's body, which is exactly what electrical fields (ELF) and electromagnetic radiation (EMR) (microwave non-ionised radiation) does.

The extreme increase of undiagnosable illnesses (syndromes) began to appear in the early 1990s, soon after the introduction of wireless technology in the late 1980s and the first wireless systems (WLAN), and by 1999 wireless technology was widely accepted. Today, the scientific research and evidence on related wireless technologies (2001-2012) suggest adverse health effects from radio frequency radiation (RFR). It's sad that intentional ignorance and blindness is the sole purpose of refuting the dangers and health risks of microwave non-ionised radiation.«
